**In vitro observation
of a MAC address**

**"mRNA" injection mixed with blood
from a non-injected person**

Subscribe

9:15 a.m.: Blood sample taken from a non-injected person and addition of a dose of mRNA to the tube

10:50 a.m.: After 1h35, a MAC address is detected

MAC address (= Media Access Control)

The MAC address is a unique number that identifies any device connected to a network or the Internet.

This identifier is unique in the world for a given connected object. It is generally stored on a network card.

The MAC address of a connected object can be detected by Bluetooth scanner applications such as Bluetooth Finder.
